# 1. Login

Navigate to the root directory of the server. This will depend on the url given when deployed. Any url path that doesn't match will redirect to this login screen.

The login algorithm is slow on purpose. Depending on how you deployed this, it could be *really* slow.

Once logged in navigate to `your.url/`room`/any.`

2. Room Usage

MENU:
- logout: logout the user
- add room: add a room to the users 10 room container
- profile: change user details
- history: keeps track of last 10 (unique) rooms user has visited
- rooms: view users rooms

CHAT ACTIONS:
- send message (send button)
- Show room info (room button)

3. Commands

All commands should follow the following structure unless otherwise documented:

```
1.      2.                              3.
~link__https://github.com/rexlx?tab=repositories__check
them out
```

1. ~link all commands start with a '~' followed by a keyword
2. All command elements are separated by a dunder "__"
3. In this case, the command needs a url and a link text

Keywords

link - create anchor tag with link that opens new tab
clear - clear room messages

~link__https://github.com/rexlx?tab=repositories__check them out

send   room
